By June 1942 the war was well underway. I applied for an officer's commission and passed my physical examination for an epidemiological unit that was to be mounted at Johns Hopkins University and sent to the Pacific. For some still unexplained reason the army bureaucracy decided not to activate the unit and I was told to await further orders. I protested by letter to Eleanor Roosevelt that I was being unfairly dealt with, and that the country was not taking sufficient advantage of needed talent. I heard again from the army, acknowledging my letter to Mrs. Roosevelt, and stating that if I wanted to I could enlist as a private, but that I would have to await further orders if I wanted to serve as an officer in a veterinary, sanitary or other suitable unit. Persichti and I sold our practice for less than a song (it wasn't worth more), and we awaited a call-up by the army. In the meantime I took a "temporary" job teaching at a veterinary school (Middlesex, later called Brandeis—closed in 1947), until December 1944.

Not having heard anything from the army by late 1944, and determined to go overseas, I joined the UN Relief and Rehabilitation Administration (UNRRA). My connections with Penn ended at that point for many years during which I satisfied a long-held desire to use my professional knowledge abroad to help less fortunate countries. I served for two years (1945-1947) as chief veterinary officer in Greece for UNRRA. Following by two years in Poland for the UN Food and Agriculture Organization helping to establish diagnostic and vaccine production laboratories, and to control major diseases many of which I knew only from textbooks (e.g., foot-and-mouth disease, rinderpest, Newcastle disease, douring, glanders). Those were memorable years filled with human and professional interest.

In 1949 I was asked by the World Health Organization (WHO) to join their headquarters staff in Geneva, Switzerland, as their only "veterinary officer" which developed soon thereafter into a “veterinary public health” (VPH) unit. The term "veterinary public health" was new to the ears of health workers and required (along with "zoonoses") many years to put on the map.

WHO provided an unparalleled opportunity to put to work my 1942 MPH degree from Penn (MPH degree awards were eliminated at Penn the following year because of a war-depleted faculty.) Physicians and health workers could accept a veterinarian on the staff occupied with such diseases as rabies and brucellosis, but they were less prepared to acknowledge competency in epidemiology, statistics, food hygiene and public health administration dealing with both human and lower animal diseases. It took about ten years to consolidate veterinary activities in human health programs on something of a global scale by bringing together the potentials and resources of health, animal health, and agriculture ministries in various countries. Three of my closest collaborators in this effort were American veterinarians—the late Ernie Tierkel (’42), Jim Steele and Bob Marshak whose names should ring bells in at least some ears (I don’t. ask Mark Allam or Bob Marshak).

After a decade of such activities at WHO I decided it was time to refresh my professional base in laboratory research by spending a sabbatical year with Hilary Koprowski who had recently taken over as director of the Wistar Institute and was struggling to give it new vitality. His outstanding success in doing this was commemorated last year at the 25th anniversary of his directorship.

It was during three sabbaticals at Wistar (’60, ’65 and ’70) that I resumed a close association with the Veterinary School, the only veterinarian professor (emeritus) who lectured also to the medical and dental students, and Roger Amadon (physiology) made up for many defects harbored more parasitic eggs per square inch than surrounding a patch of ground that probably was’t much exception because I can’t vouch for the accuracy of numbers of classmatess and other quantitative elements and, living in Europe, I do not have easy access to such information.

The years 1936-1940 were not the most brilliant ones of the Veterinary School. The physical plant consisted principally of old brick buildings surrounding a patch of ground that probably harbored more parasitic eggs per square inch than any other turf in the world—the exercise area for dogs treated with an antihelmintic. Starting (if I recall correctly) with a class of 48 students we ended up with a graduating class of 29 which had to survive unbelievable examination questions requiring pure (and useless) rote memory (shades of "On Old Olympus Towering Tops", etc., for the cranial nerves). Joseph McFarland, our pathology professor (emeritus) who lectured also to the medical and dental students, and Roger Amadon (physiology) made up for many defects in the veterinary faculty.

We were graduated into an uncertain world with war on the horizon, so I decided that further study would not be amiss. My classmate Karl Persichti and I opened an office for mixed practice and clinical laboratory examinations (human and veterinary) on Old York Road. The office was in a row of run-down and abandoned stores, around the corner from the most successful small animal practitioner in Pennsylvania. Alan Bachrach. He rightly did not fear our competition, and kindly helped us with difficult cases, as did Mort Grasse of Jenkintown. Our income barely covered our minimum expenses and there was plenty of time for study. I was able to complete a Master of Public Health (MPH) degree in 1942 at Penn's Graduate School of Medicine, the only veterinarian in a class of nine (eight physicists). I was dealt with on an equal level with the physicians, and covered purely human medical subjects (e.g., pediatrics). My master's thesis was on polypotent vaccines for children (tetanus, diphtheria and pertussis), and our class received master’s instruction from Joseph Stokes Sr. on the drawn out arsenical-bismuth regimes for syphilis and potassium permanganate infusions for gonorrhea, the classical treatments still in use at that time.
